

Thanks for installing the asset!

To create a pixelation effect in your project, simply add the Pixel Camera prefab to the scene. You can adjust the parameters either from the code or from the editor by changing the script values on the same prefab.

The functionality that you will mostly need:

1. `PixelCameraEffect.PixelCamera.Instance.IsOn` allows you to activate and deactivate the effect;
2. `PixelCameraEffect.PixelCamera.Instance.ScreenScale` is responsible for the number of pixels on the screen;

All files are signed and placed in their respective folders, so I think there will be no problems. Otherwise, write to the mail isleofassets@gmail.com

Please do not forget to rate this asset in the Asset Store! :)
